

Are 3D Eyebrows Right for Me

Permanent makeup can generate amazing results, but it is important for you to understand if you are a good candidate for the service before going through with the procedure.

Things to Keep in Mind:

- If you have really oily, thick skin, 3D brows may not work well for you but Jill is happy to perform the procedure on you as long as you have a realistic expectation.
 - The constant production of oil in your skin can cause the hair strokes to heal with a much softer look, similar to that of powdered or penciled in brows. If additional touch-ups are needed as a result, there will be an additional cost.
- If you are a frequent smoker, your pigment will fade sooner. This does not mean you cannot have the procedure done, but more frequent touch-ups may be required at an additional charge.
- If you are iron deficient or Anemic, your pigment will fade sooner and bleeding or bruising may happen during or after the procedure.
- Unhealthy, compromised skin from health issues, medications and over use of anti-aging and acne products are all contributing factors as to how your skin will retain the pigment.
- To keep your 3D brows looking fresh, a “booster” appointment is recommended every 1-3 years. Results will vary with each client and health of their skin.
- Clients with darker skin (Indian, African American, Filipino, etc...), please know that hair strokes will not appear as defined or as dark as lighter skin types due to the skin color already being naturally darker.

Those Whom are Probably Not Good Candidates for 3D Eyebrows are Those Who:

- Have heart conditions or pace makers
- Keloid (raised scarring)
 - You must consult with your doctor if this happens to you and bring documentation of his/her approval
- Are on a lot of medications (you will bleed more as a result and pigment will not retain as well)
 - If you want permanent makeup done you need to consult with your doctor prior and bring documentation of his/her approval
- Are on the following medications:

Triflusal (Disgren)	Clopidogrel (Plavix)	Prasugrel (Effient)	Ticagrelor (Brilinta)
Ticlopidine (Ticlid)	Cilostazol (Pletal)	Vorapaxar (Zontivity)	Dipyridamole (Persantine)
Coumadin	Pradaxia (Dabigatran)	Xarelto (Rivaraxaban)	Eliquis (Apixaban)
Savaysa (Edoxaban)			

While there can be many factors that come into play when determining if you are a good candidate for permanent makeup, please understand that it is all in the best interest of the client when determining if you should receive this service.

The goal is for clients to have clear expectations of what to expect for results based on your medical history and lifestyle.
